

CLAIMS

1. A process for the production of propylene starting from mixtures of hydrocarbons, prevalently olefins, the above hydrocarbons having a boiling point ranging from
5 -15°C to +80°C, which comprises putting the above mixture of hydrocarbons in contact, under cracking conditions, with a large-pore zeolite having a molar ratio Silica/Alumina lower than 200.
2. The process according to claim 1, characterized in
10 that the mixture of hydrocarbons has a boiling point ranging from -12°C to +60°C.
3. The process according to claim 1, characterized in that the zeolite is a ZSM-12 zeolite.
4. The process according to claim 3, characterized in
15 that the ZSM-12 zeolite has a molar ratio Silica/Alumina ranging from 50 to 150.
5. The process according to claim 1, characterized in that the mixture of hydrocarbons comprises from 30% to 100% by weight of olefins.
- 20 6. The process according to claim 5, characterized in that the mixture of hydrocarbons has a content of 40% to 85% by weight of olefins.
7. The process according to claim 1, characterized in that the process is carried out at a temperature ranging
25 from 400°C to 750°C.

8. The process according to claim 7, characterized in that the temperature ranges from 450°C to 700°C.

9. The process according to claim 8, characterized in that the temperature ranges from 500°C to 650°C.

5 10. The process according to claim 1, characterized in that it is carried out at a weight hourly space velocity (WHSV) ranging from 0.1 h⁻¹ to 1,000 h⁻¹.

11. The process according to claim 10, characterized in that the weight hourly space velocity ranges from 0.5 h⁻¹
10 to 100 h⁻¹.

12. The process according to claim 11, characterized in that the weight hourly space velocity ranges from 0.8 h⁻¹ to 50 h⁻¹.
